

Experiencing the Wilds of UluMuda

Located at the eastern frontier of Kedah bordering the Thai province of Yala, this 164,000ha lowland and hill dipterocarp forest is home to most of Malaysia's large mammals. You will find about 335 species of birds including all 10 Hornbill species found in Malaysia including the very rare and globally threatened Plain-pouched Hornbill.

Our journey starts at the Muda Lake Jetty some 150km from Georgetown, Penang. A one-hour ride on a traditional long-tailed wooden boat across the lake and up the Muda River will take us to *Earth Lodge* at Kuala Labua. Some of the activities you can experience include visits to salt licks, swimming and frolicking in cold forest streams, tubing down river, visit a limestone hill and its mysterious cave and watching birds and other wildlife. You can also just laze around the lodge grounds listening to nature's jungle music and being awakened by the haunting call of the Agile Gibbons.

Earth Lodge is a small ecolodge that continuously strive to have low ecological footprint and practice true ecotourism principles. It is also the base for the Ulu Muda Field Research Center. Our aim is to help raise awareness of the significance of this important forest landscape and to promote research. There are eight twin rooms and three 6-bed dorms available for guests. All with a balcony and bathroom attached.
